PROFESSIONAL SUMMARY

Full Stack Developer with production experience building end-to-end web platforms for the financial and public sectors. Specialized in React, Angular, ASP.NET Core (C#) and Node.js/Express, working with SQL Server, PostgreSQL and MongoDB databases. Experienced in modular architecture, secure REST APIs (JWT, 2FA, OWASP), integration with external services (Azure OpenAI, Lambda functions, SendGrid, government APIs) and Azure deployments with CI/CD on Azure DevOps.

WORK EXPERIENCE

Full Stack Software Developer — Solvex Dominicana

January 2025 – present

- Full stack development of web applications from scratch: React and Angular frontends, REST APIs in ASP.NET Core (C#) and Node.js, and integrations with external services (government APIs, client Lambda functions, Azure OpenAI and SendGrid for transactional email).
- Contributed to public and financial sector projects (AFP Siembra, INCABIDE, INFOTEP) across the full lifecycle: architecture, development, testing and deployment.
- Worked in a Scrum team with pull-request code reviews and continuous integration through build and deployment pipelines on Azure DevOps.
- Maintained Azure App Services with deployment slots for DEV, QA and production, managing and updating environment variables to continuously deliver new features to live environments.

IT Lead and Data Entry Clerk — P&P Consulteam

February 2024 – January 2025

- Handled data entry and Excel tracking for job calculations (aluminum profile and glass breakdowns per project), invoicing and material inventory.
- Prepared quotes, invoices and job documentation, and recorded the business's purchases and sales.
- Managed inventory of profiles, glass and hardware, updating it based on stock in, stock out and per-job usage.
- Provided IT support to staff on digital tools and resolved day-to-day issues.

Freelance Full Stack Software Developer

February 2024 – present

- Designed and built **Desglosalo** for P&P Consulteam's doors and windows workshop: custom software that digitizes and automates each window's breakdown, profile and glass cut optimization, job history and invoicing (details under Featured projects).
- Gathered requirements with the workshop and designed the architecture, data model and business logic end to end.
- **Impact:** calculation time per job dropped from 20–25 min to 5–7 min, with less material waste thanks to a cut optimization algorithm (bin packing).
- Ongoing maintenance and development of the product, with a new version in progress (details under Featured projects).

Electrical Technician — ETED (Dominican Electric Transmission Company)

July 2023 – February 2024

- Worked with Protection, Control and Metering (PC&M) panels at national transmission grid substations — panels that communicate over data networks and verify connection status through software.
- Software-based verification and diagnostics of communications and connections in protection and control equipment.
- Fault analysis and equipment verification under regulated operating standards, within multidisciplinary technical teams.

FEATURED PROJECTS

Desglosalo — Window Breakdown and Cut Optimization System (Freelance, personal project)

- Calculation engine that turns each window's opening size into its full breakdown (track-head, side, jamb, roller and glass), using rules per profile type (P65, P92, Traditional) and per number of tracks (2 to 5), with exact arithmetic in sixteenths of an inch.
- 1D cut optimization for profiles and 2D for glass (Guillotine bin packing with rotation), grouping pieces by profile, color and series to use the fewest bars and sheets.
- Cutting diagrams for the workshop with a materials and waste summary, traceable order history and a customer invoice at the close of each job.
- Cutting formulas that only the expert used to know now live in the system: anyone in the workshop can produce a correct cut sheet.

- **In progress (v2):** migration to .NET 10 + React 19 as a PWA and desktop app (Tauri), with quotes, tax invoicing (NCF/ITBIS), partial payments, inventory with automatic consumption and real cost per order.
- Current stack: React, Tailwind CSS, Zustand, TanStack Query, Motion · Node.js, Express, REST API · Python (rectpack).

Vision 360 — AFP Siembra (Solvex · Full Stack Developer)

- Retirement planning web platform with an in-house actuarial engine and AI-generated recommendations.
- .NET 10 API (Minimal API, EF Core, Azure SQL) with 29 endpoints and a pure actuarial engine: mortality table, life annuity, pension projection and financial health score, tested with xUnit.
- React 19 frontend (shadcn/ui, Zustand, Zod, Recharts): 5-step guided flow, real-time simulator and downloadable retirement plan.
- Generative AI with Azure OpenAI for personalized savings recommendations and retirement scenarios; transactional email with SendGrid.
- Security and cloud: JWT RS256 with Azure Key Vault, AES-256 database encryption, Managed Identity with no secrets in code, and CI/CD on Azure Pipelines (DEV/QA/PROD).
- Integration with and consumption of the AFP's external Lambda functions (serverless, TypeScript) through OpenAPI contracts, letting the AFP customize its data from its own platform with no changes to the production environment.

INCABIDE — Auction Management System (Solvex · 2026)

- Platform for the National Institute for the Custody and Administration of Seized Assets (Dominican Republic) that manages the full public auction lifecycle: inventory, participant registration and validation, guarantees, live auction, settlement and contracts.
- .NET 10 / C# backend with a modular monolith architecture (13 modules), EF Core and Azure SQL; Angular 21 and Tailwind frontend.
- Authentication with JWT, rotating refresh tokens, 2FA and role- and permission-based access control; immutable audit log protected at the database level.
- Integration with government services (JCE, DGII, Comptroller General) to validate participants, email notifications with SendGrid, and real-time in-person auctions over WebSocket.
- Inter-module messaging with the Outbox pattern; architecture tests (ArchUnitNET), unit and integration tests (Testcontainers).
- Stack: .NET 10 · C# · ASP.NET Core · EF Core · SQL Server · Angular · TypeScript · Tailwind · SendGrid · xUnit.

INFOTEP — Application Refactoring and Security (Solvex · 2026)

- Frontend: refactored existing modules and built shared components to unify the UI, improve scalability and speed up development of new features.
- C# backend: OWASP security audit of several microservices, applying the resulting fixes and best practices, and building new endpoint features based on team requirements.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, C#, Python

Frontend: HTML, CSS, React, Next.js, Angular, React Native, Tailwind CSS, Zustand, Context API, Redux, Vite

Backend: Node.js, Express, .NET (ASP.NET Core MVC, Web API), Entity Framework Core, REST APIs

Databases: SQL Server, PostgreSQL, MongoDB

Methodologies: Scrum (ceremonies, sprints), code review, CI/CD

Tools: Git, GitHub, Azure DevOps, Azure Portal, Docker, Figma, Jira, Render, Vercel

EDUCATION AND COURSES

Mechatronics Technician — Instituto Tecnológico de las Américas (ITLA)

Electrical Technician — Instituto Técnico Salesiano (ITESA)

- Full Stack Developer — Alterna Academy Bootcamp
- The Complete Full-Stack Web Development Bootcamp — Udemy

LANGUAGES

Spanish — Native · English — B2 (Upper Intermediate)
